## Re: Fix For Mac

The Spotlight search tool has been improved significantly over the past few years, and it appears to improve with each and every version of OS X, with Yosemite it got much better.. Spotlight is an innovative search technology built into Mac OS X that makes an index of pretty much everything on your storage devices connected to your computer – including videos, audios, pictures, contacts, email messages, and even calendar events – and then uses this index to search and get information from your storage devices.. Now it can perform unit conversions, calculations and even search for movie information for you.
